

Simmons Epoxy Resin Worktops and Sinks Care & Maintenance

As with all worktops a reasonable standard of laboratory housekeeping will help to keep Simmons epoxy resin worktops and sinks in good condition.

All spillages should be cleaned up as soon as possible. Staining agents and aggressive chemicals should not be allowed to sit in contact with the tops for a prolonged period of time.

If water or standard cleaning products are ineffective, more stubborn dirt and stains can be removed by wiping with acetone or similar organic thinners. This will not affect the worktop or sink in any way.

Areas of more serious chemical attack or staining can be removed with a polishing compound or very fine abrasive paper but it should be stressed that this will alter the finish of the surface. As a homogenous solid product, performance of the worktop or sink will not be affected.

The use of a wax furniture polish will help to retain the gloss finish.

Epoxy Resin components are not suitable for use with Dry Ice or Liquid Nitrogen.
